

Supply Chain

Stock Requisitions

Simplify stock requisitions by empowering the end user.

- Create a flexible stock requisition life cycle by defining your own stock requisition processes
- Switch between processing stages with efficient 'power user' functions

Key features and benefits

Total flexibility

Define your own stock requisition process by customising functions, providing total flexibility to execute your business process.

End user control

Allocate stock to outstanding backorders and create pick-lists based on different criteria. Confirm receipt for transfers by allowing the user to scan the barcode of the shipment automatically, or manually process the receipt.

Efficient functionality

Raise stock requisitions as either an 'issue' or 'transfer' requisition. An 'issue' requisition will expense stock from a location against a ledger code and account number, generating the account via multi level account masking. A 'transfer' requisition is used to transfer stock quantity and value between two inventory locations.

Switch between processing stages

Quickly switch between processing stages from a single screen with the 'power user' function, to enable efficient business processes.
